

## Hosting Static Website on Storage

1 : Create a storage account in Azure.

2 : Go to Storage browser to see the blob storage.

3 : Go to Data Mgmt Blade and then Enable static website which will create a \$web container in which we will put all our static files.

eg : Put all the react static files from the build folder in \$web.

4 : This will expose a URL in Static Website blade under **Primary Endpoint**. Give the name of the html document (index.html).

5 : We can connect to the static files on the storage account even by running the backend application locally by having storage account url inside the application's config.
